

Anesthesia

Anesthesia does not pose a particular problem in patients with lymphedema.

WHAT IS RECOMMENDED

- No specific recommendations related to the management of a patient with lymphedema.
- If necessary, blood samples, infusions and blood pressure can be performed on the affected limb. However due to the volume of the limb, which can make these procedures more difficult, the use of an unaffected limb is preferred if possible.

WHAT YOU SHOULD NOT DO

- No specific recommendations.
